

Ajna Design System

Ajna Design System

Bringing structure, speed, and dark mode to our internal tools

Summary

Helped build and scale the Ajna Design System , a reusable, responsive 2D design system for internal tools. I focused on component functionality, dark mode implementation, and learning advanced use cases of Figma variables.

My Role

- Structured components using variants and variables
- Applied Figma variable modes to enable one-click dark mode
- Used auto layout + variables to ensure responsive behavior
- Documented usage and worked closely with developers to ensure feasibility
- Explored edge cases through real-world use and feedback loops

Problem

Internal tools lacked visual consistency. Every team was designing the same buttons, forms, and layouts again and again , wasting time and introducing inconsistencies.

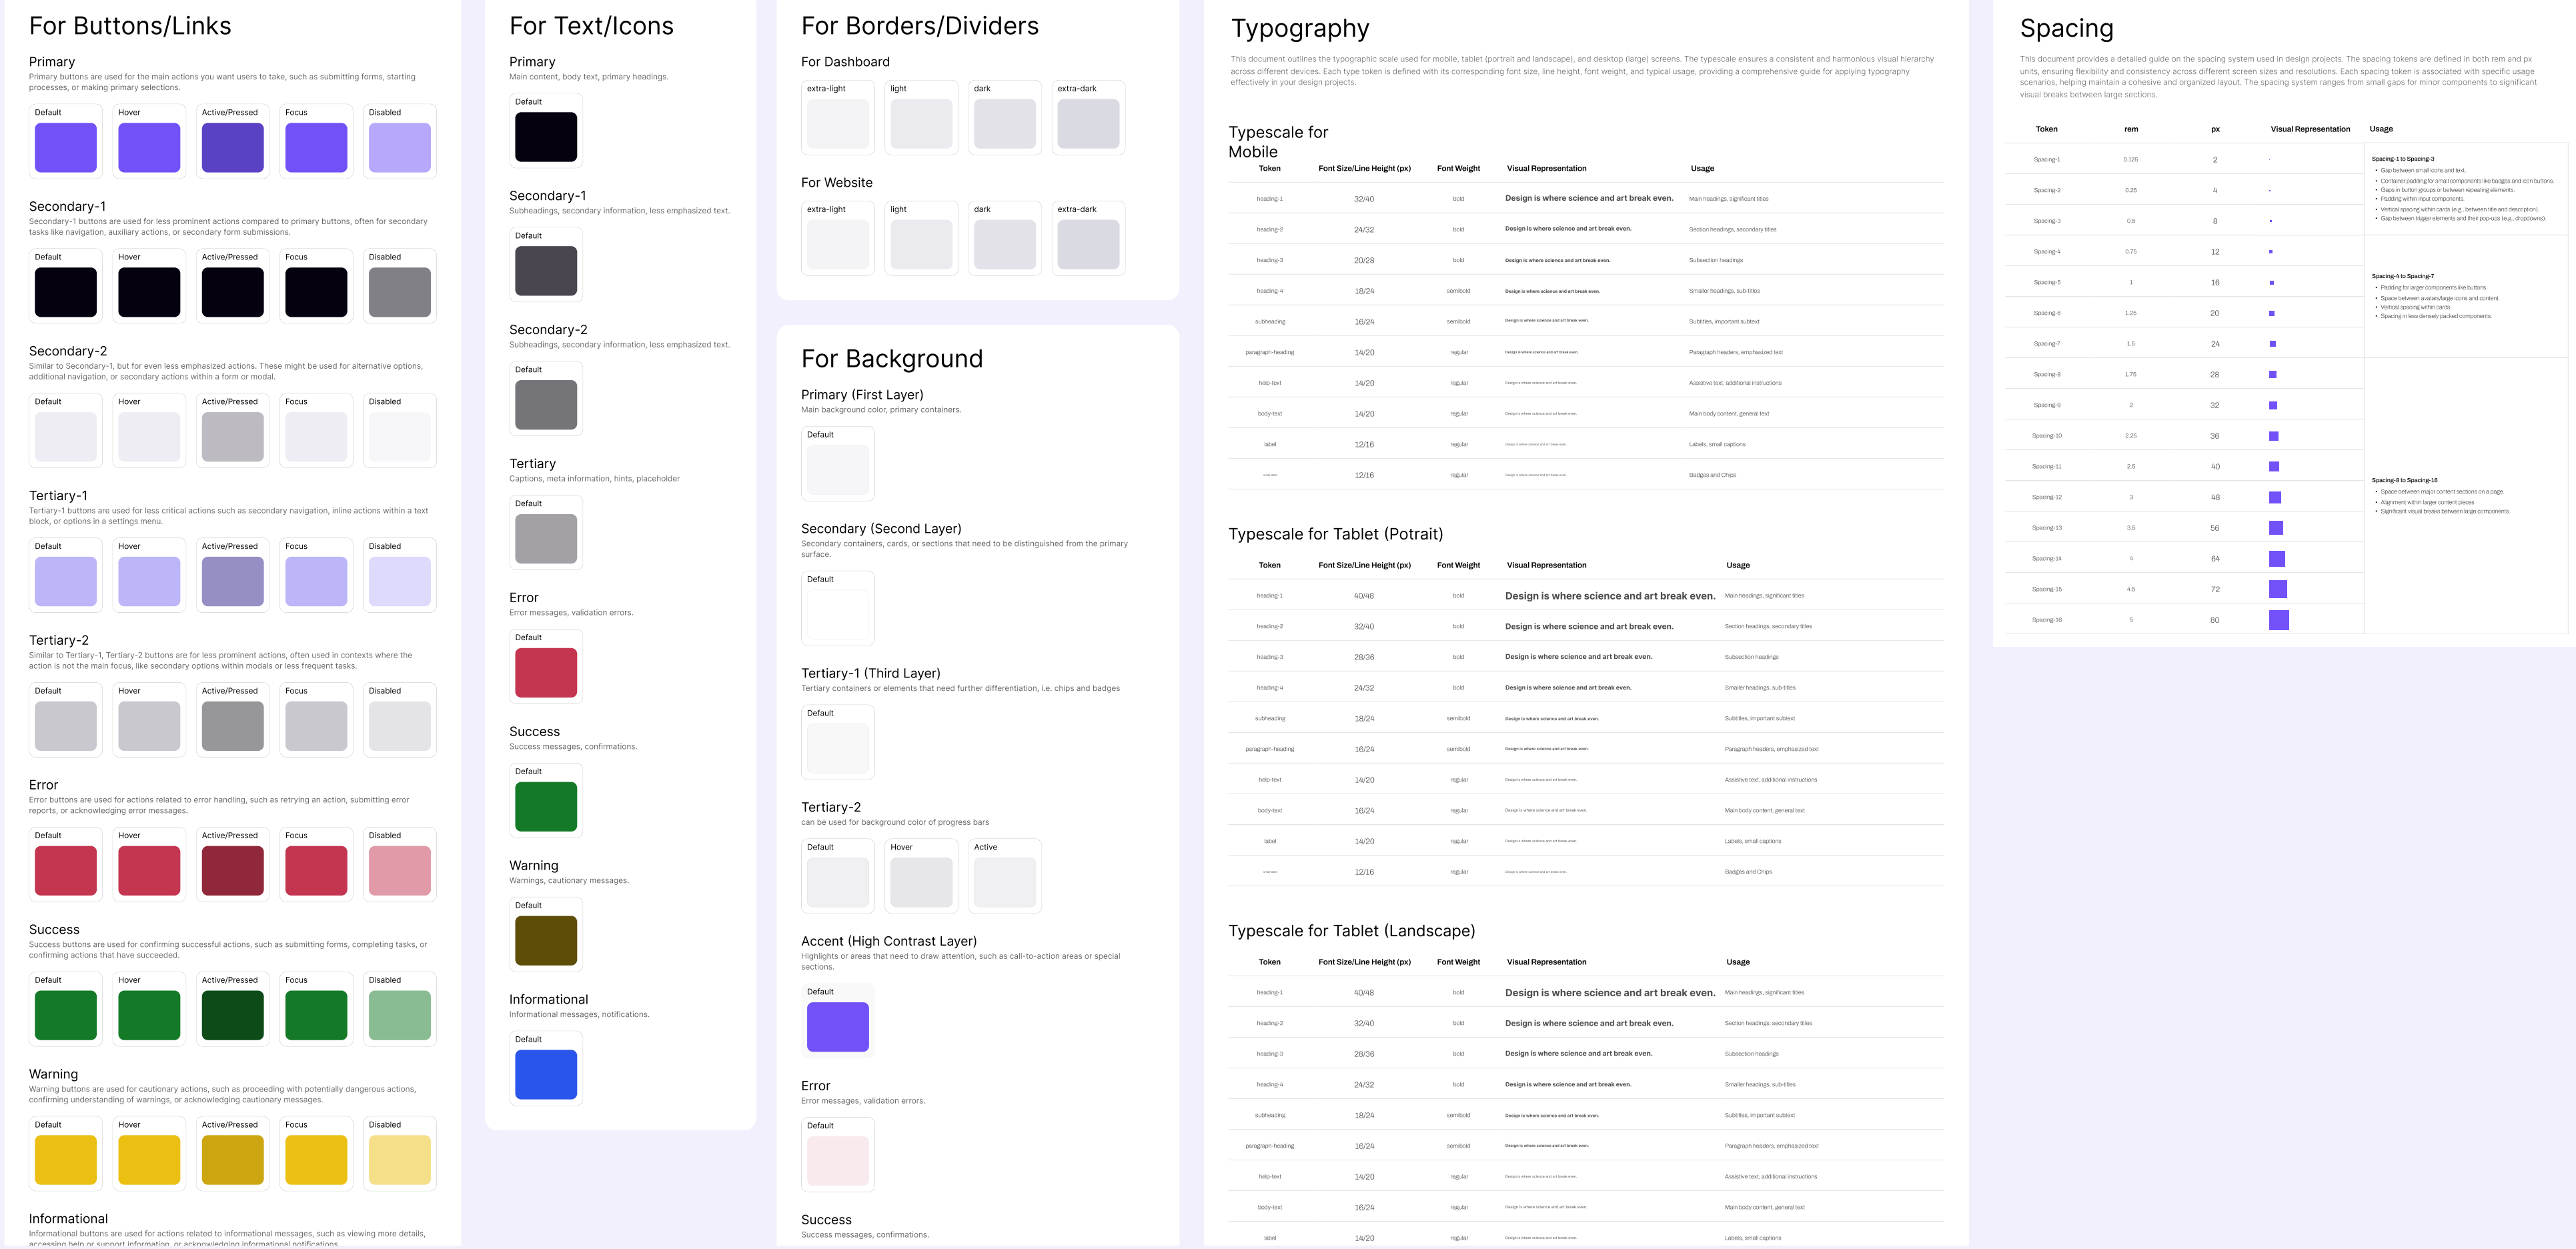

Who it was for?

- Product and engineering teams
- Designers
- Developers

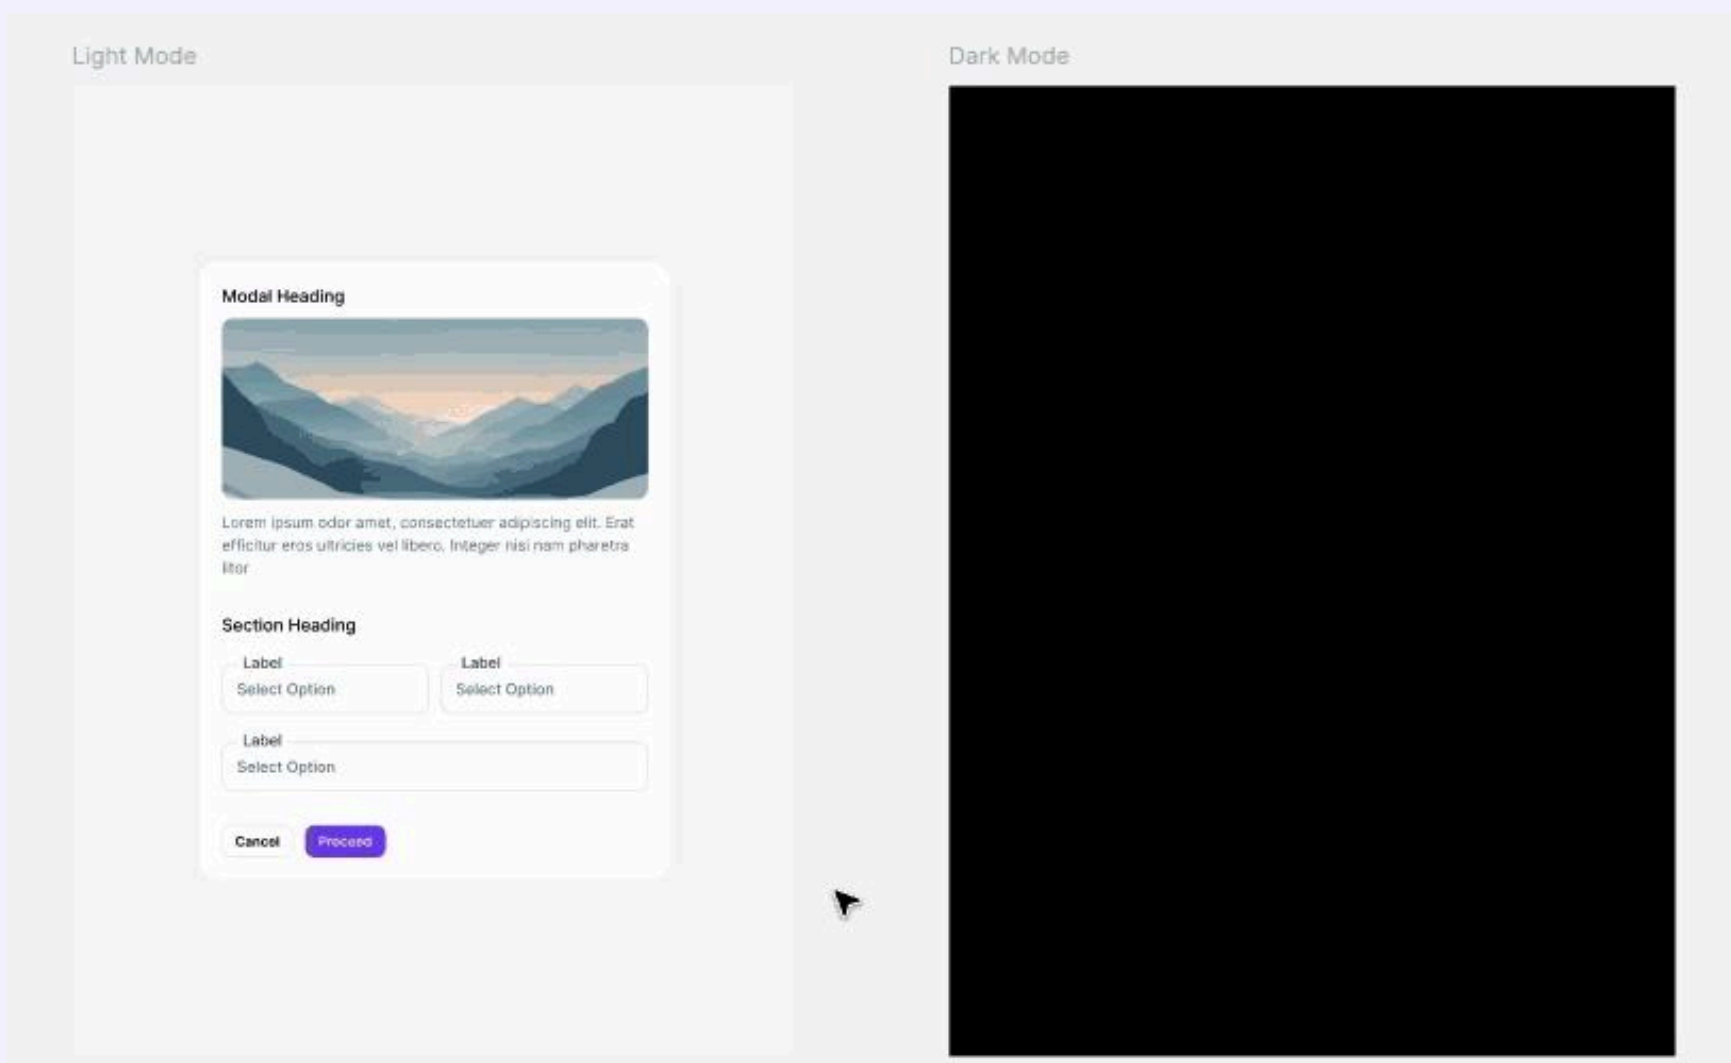

Research Insights

- Inconsistent visual patterns across tools
- Developers needed cleaner specs to reduce back-and-forth
- Designers wanted ready-made templates and variants to move faster

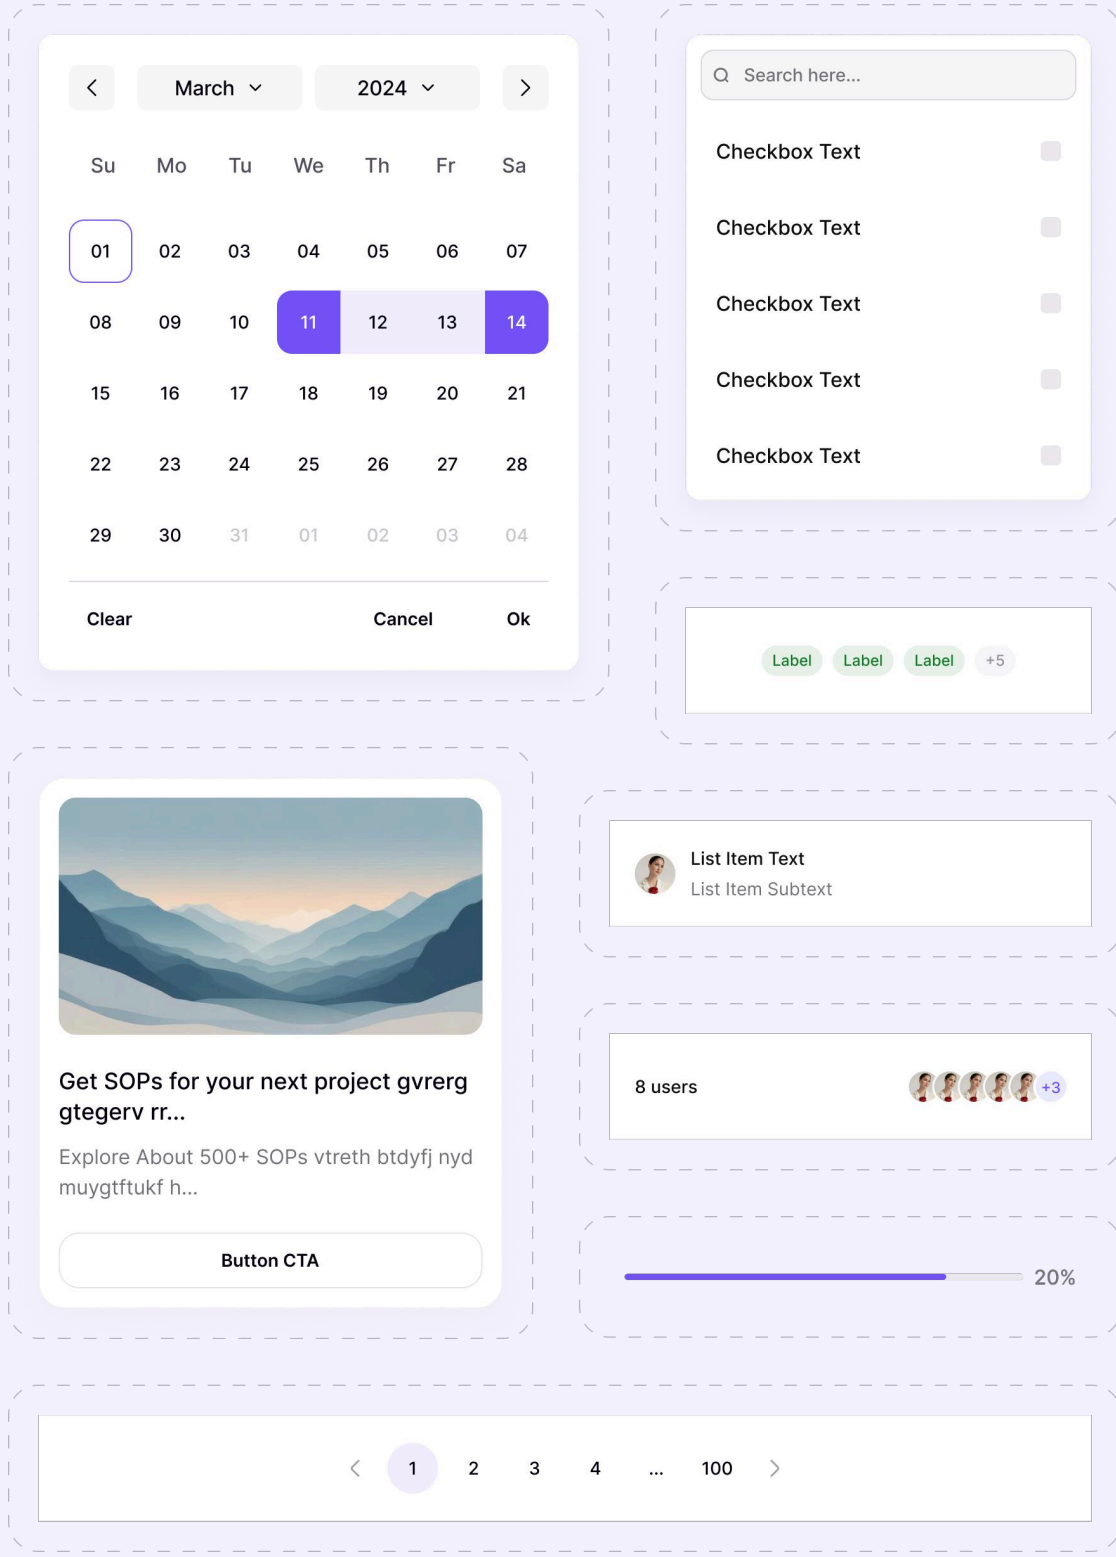

Process & Learnings

Audited existing screens to identify patterns and built base tokens for spacing, typography, radius, and color

Learned how variables power scalable UI and theme switching

Created layered components with clear logic for overrides

Improved system over time by collecting use feedback from teams

Constraints & Trade-offs

- Needed to work with existing design legacy where possible
- Prioritized depth over breadth , fewer components, better quality
- Scoped system to 2D only for faster adoption across teams

40% faster design workflow for common flows

Clearer specs = fewer dev questions

Reflection

Working on Ajna taught me the power of good structure. I learned how small decisions in token naming or variable logic can impact teams weeks later. The dark mode toggle was fun to build , but the biggest win was watching other designers move faster, with less friction.

Dark mode toggle adopted across all tools

Starting point for internal products
